

METHODS AND SYSTEMS FOR CALL PROCESSING UTILIZING A UNIFORM RESOURCE LOCATOR

Abstract of the Disclosure

The present invention provides systems and methods for processing calls over
a network using a web page. In one embodiment, a server receives a user call request
generated by a user activating a web page call request control, which submits a uniform
resource locator (URL) corresponding to a networked resource. Data for a first
telephone number corresponding to the requested URL is downloaded to a client
computer used to place the call request. A call client requests that a call connection be
established between the user client computer and a communication terminal
corresponding to the telephone number. The call connection is then established.
